Notes in brief regarding the tactics of sabotage and terrorist acts (DTA)

An analysis of an investigation carried out on activities of a terrorist nature allows you to identify the most characteristic features of their (terrorist) training. In all known cases, refer to the place of the previously studied regarding terrorists and their accomplices.

Typical signs of preparation for terrorist acts:

Video and photography object; monitoring (including with the use of technical equipment - binoculars, telescopes); charting object and how to approach it, an attempt to obtain data about the system of protection and defense of the object, search the possibility of acquiring, purchasing or the presence of explosives substances (components), Explosives, which can be used in the manufacture of improvised explosive devices (IEDs), as well as regular ammunition, including artillery and weapons acquisition party electronic clocks of different systems, receivers (pagers) and small radios, car purchase common models of domestic production, primarily used without notarization the right to use, avoidance of re-registration of purchased cars in the prescribed manner by requisite traffic police, disregard for the technical condition, especially the appearance of the purchased vehicle; installation on vehicles duplicate, temporary and auxiliary systems of dubious necessity (fuel, electrical equipment), collecting, buying various metal objects (nuts, bolts, parts of ball and roller bearings, etc.);

The appearance of persons in behavior that is seen studying the situation, the rise and at the same time interest in certain aspects in the activities of a facility is a possibility for terrorist acts; scouting (spying) on others for information regarding operation of the object, the order of access to it; penetration into the basements and attics of multistory buildings, those without them, any - or relationships, the abandonment of the person or finding in crowded places unattended packages, bags, bundles, the presence on the person hidden under clothing items; statements of intention to DTA, attempts to change the appearance, including with the help of

make-up, false mustaches, wigs, bandages, frequent , unmotivated change of outerwear, purchase of the necessary accessories to change the appearance, the purchase, the availability of documents with different setting data, offer little significant suggestion of work for solid reward: driving of cars, transport package (bag, convolution, etc.), the transfer of parcels in, including passenger rail and road transport.

The tactical models in the commission of terrorist acts with the use of DTA IEDs are the following typical steps:

Exploration method of the DTA and 'performers'. At the same time, depending on the goals of the terrorist organization the 'performers' can be pre-calculated as being waste material. The operation plan given 'performers' is more that of psychological treatment. The same 'performers' are taught that the action is completely normal, ie. by including measures to ensure their withdrawal, security and so on, which is false.

Arsenal methods used by terrorists to improve the DTA is very broad:

Laying of improvised explosive devices in cars, cellars of houses or flats, setting bombs, disguised as a pavement or a fence, suicide bombers, which can be used as drivers of vehicles, bombs, or may themselves be carriers of IED; -Capture aircraft with the purpose of ram facilities, use of swimming and flying vehicles.

When laying land mines are considered first: a disguise for road repairs, operations workers landscapers, etc. Bookmark IED produced in sewers and under the pavement.

From the investigation of DTA options the most marked ways of placing IEDs, by 'shahid belt' (chest, thigh, waist, including simulating pregnancy) to camouflage the product (for example, women's handbags; video camera; Handy, a diplomat).

In recent years, for the commission of terrorist acts in the underground of illegal armed groups prefer the use of suicide bombers, which they referred to as strategic weapons. Suicide - this, in most cases, refers to young men and women 20-35 years. On the suicide mission, as a rule, they are sent in pairs (one - the 'performer', the second - the 'controller'). If the terrorist will not perform the act, ie. change his/her mind to die, the controller will eliminate him/her. The destruction is planned via suicide.
