## Encrypting of Messages

Cipher Kronfeld

Cipher Kronfeld. This is a good and reliable Intelligence cipher with high secrecy.

The key to this cipher, there are millions. The key is the conditional number - from a four to eight-digit.

If the number is less than a four, it lowers the secret code. Numbers more than eight-should not be used, ie. A. They are difficult to remember, and the spy has the right to record and carry with them the key to the cipher. The most practical is a five-digit number.

Working with the code Kronfeld is very simple and is as follows: Suppose that you have the key number 35264. The number of five-digits and here we split into groups of five letters each. If we want to encrypt. "DANGER Do not come", it would look like this:

Key: 35264 35264 35264 3526  
Text: na Drive Dangers CORRECTIVE  
Encrypt .: RKSTSM IMIZHN SFVCHS STSFV

Then, the encrypted phrase is: RKSTSMIMIZHNSFVCHSSTSFV. Instead, each letter of our letters we write another letter - the letter in the alphabet that is after it in such a place, pointed to a figure standing over.

For example: the first letter in our letter H, but above it is number 3, and so we write instead of the letter N the letter P in the alphabet which is in third place after N.

For the convenience of encryption and decryption to write well in a series of the entire alphabet plus nine letters of the alphabet of the second.

ABVGDEZHZIYKLMNOPRSTUFHTSCHSHSCHYEYUYAABVGDEZHZI ...

Thus you can quickly count.

To increase privacy for use of control characters and figure a hurry (the importance of), you can use the blind letters before cipher text.
