Topic : Methods of chambering the cartridge in the chamber

To make a shot, it is necessary to charge the weapon. There are at least four ways to secure chambering the cartridge in the chamber.

The first method. The shooter grips between thumb and index finger bent back of the bolt. Firm pulls the frame out until it stops and releases. The gate frame under the influence of the return spring returns to its original position, and is sent round in the chamber. This method is versatile and is suitable for most models of pistols.

The second method. The rear of the bolt is clamped between the palm and four fingers. The shutter is delayed in its rearmost position and released. After chambering cartridge weak fingers and hands straighten moving to grip without crossing the muzzle. Window ejector must not close the hand.

The third way. The front part of the bolt is clamped between the palm and four fingers. Window ejector must not close the hand. After chambering the cartridge in the chamber, as in the second method, the fingers are straightened to grip and move without intersecting the muzzle.

The second and third methods are used when the gun has strong return spring. Also, this method is used by juniors, women and with insufficiently strong hands. In these processes, chambering a cartridge needs to be carried out with care - not to close the window of the ejector gate. If the window is closed hand while eliminating the delay or misfires, then Insert, leaning on hand, may stumble on the sharp capsule of the shutter. Then the cartridge will rupture and injury hand.

The fourth way. Sports. The front part of the bolt is inserted into the crotch between the thumb and forefinger of a weak hand. The gate is clamped between the upper edge of his hand and right index finger. When chambering a cartridge in the chamber brush weak hand slips down and goes into the grip.

The fourth way is probably the quickest, but less reliable. It needs some work. Good for pistols with a weak return spring.
